# VARSHA GROW BAGS

Varsha Grow Bags are made from the finest cocopeat and are packed in UV stabilized bags. These are made in both Horizontal & Vertical Shapes. These bags are made to grow single plants like capsicum and multiple plants like tomatoes, cucumber etc.

## Why Varsha Grow Bags

1.Quality : We make our cocopeat in highly automated production lines. Our cocopeat is   made from selected coco husks from a dedicated place. The husks are defibered  and the  cocopeat is sieved. The sieved cocopeat is washed with RO water and treated to get  the  correct EC & PH. This is dried in special concrete  drying yards to avoid any contamination. The dried cocopeat is subjected to air winnowing to remove small stones & grit. After this the cocopeat is compressed to make blocks. These blocks are compressed sufficiently to fill the bags exactly. The drying, sifting and blocking process ensures correct expansion. Also, the blocks retain the properties for more than one year.

2.   Economy: The correct size, expansion and quality ensure our economy bags. This is   very important because,

 (i)   If the cocopeat does not expand completely the yield will be affected (the expanded material should fill the bags completely).

 (ii)   The qualities like EC, PH & water holding capacity will ultimately determine the yield per bag of the end product. Varsha Grow Bags produce the best results economically.

3.   Varsha Grow Bags can be stored for more than an year withought any variation in the properties like expansion and yield of cocopeat.

4.   Spacer trays are provided for good aeration and stability to the grow bags. Also provide microw reservoirs at the bottom.

"VARSHA GROW BAGS" are the best tools in the hands of soilless cultivators of vegetable & flower.
