Hansa  
Forestry

Peat is an excellent choice for growing blueberries because it mimics the natural forest environment where blueberries thrive. These plants naturally grow in acidic, moist conditions found in forested areas with organic matter like peat moss. By using peat, you create an ideal habitat that promotes healthy growth and delicious fruit production, just like in the wild.

**Optimal Soil Acidity:** Peat provides the ideal acidic environment that blueberries require to thrive, promoting healthy growth and abundant fruiting. Acidic environment also protects from insects and pests.

**Moisture Retention:** Peat helps retain moisture while allowing good drainage, ensuring that blueberry plants receive the right amount of water without becoming waterlogged.

**Our peat is organic:** Our peat is OMRI certified, which helps our growers to obtain the certificate of organically grown blueberries, to take top shelves in the stores.
